SUMMARY OF RESEARCH

Dr. White is a materials scientist focused on understanding and optimizing engineering and environmental materials, including sustainable cements and materials for carbon capture, utilization and storage. One main thrust of her research portfolio entails the discovery and control of the chemical mechanisms responsible for formation and long-term degradation of low-CO₂ cements and related systems. A second thrust is the development of 2D and layered materials for carbon capture with significantly reduced energy requirements for material regeneration. This research spans multiple length and time scales, utilizing advanced synchrotron and neutron-based experimental techniques, and atomic and mesoscale simulation methodologies.
